

Enterprise Data Replication

Business Links Data-Replication Services include proper design, installation and configuration of top-tier Data Replication products from hardware vendors such as EMC, Network Appliance, IBM, in addition to host-based mirroring, and clustering solutions from

Veritas (Symantec). In addition to ensuring a timely, cost-effective deployment that cuts risk and speeds up results, Business Links professionals efficiently handle the end-to-end complexities associated with design, installation and optimization tasks.

Data Replication

Data-Replication techniques such as SnapMirror, SRDF and TrueCopy are considered highly reliable for replication and migration of data across Geographic boundaries

Depending upon your Data Replication needs, our recommended solution(s) can range from a real-time, Disaster Tolerant "Synchronous" as well as "Asynchronous" replication between Storage arrays and application servers to local host-based replication capabilities for easily

manageable mirroring and snapshots of critical business data. Irrespective of the solution you choose to implement, you will gain powerful capabilities to perform onsite point-to-point replication or across geographically separated data centers via metro-clusters and, FCIP based WAN solutions.
